INTRODUCTION

Chain Legion is an RPG project on the BNBchain which aims to provide an immersive role-playing experience through NFTs.

The nature of NFTs provide the compatibility for the most fundamental aspect of every RPG game in existence - unique character identity. No two characters are the same, as no two players are the same.

Chain Legion features a limited set of mintable NFTs which represent playable in-game characters. Each legionnaire starts off with a blank slate, and it is up to the player to customize it as they see fit.

WORLDBUILDING

Lore represents one of the main pillars upon which Chain Legion has been built. Every action that a player can take in-game is directly correlated to some part of the story-line.

The team will establish a base storyline which will serve as a core story for the universe. This base will be colloquially referred to as the initial lore. Every story addition which is introduced down the road will have direct ties to the initial lore.

Story proposals will be open at all times, and anyone with a passion for writing or creating in-depth geopolitical or historical events will be able to propose official additions to the Chain Legion canon universe.

LEVELING

Every legionnaire comes into existence as a level 1 character, with a clean slate of attribute points

Players can allocate points towards these attributes to create different builds, depending on the play-style they would like to achieve.

Each level grants an additional amount of attribute points to spend. Bigger the level, bigger the attribute point pool, thus resulting in a more powerful character.

PLAYER VS PLAYER

Players can face each other in 1v1 battles in the battle arena.

Two cornerstones of every PvP battle are:

- Attribute points
- On-chain dice rolls

Battles have a turn-based structure, but are contained within a single on-chain transaction.

In order to produce lifelike encounters, a factor of randomness must be taken into account. Chain Legion contracts rely on ChainLink VRF oracles to provide verifiable on-chain randomness.

BATTLE PROCESS

Battles are structured around attacks. Each time a player attacks, a die is rolled to include a randomness factor into the equation.

Depending on the roll, an attack can be effective or ineffective.

Upon the roll, the damage done is subtracted from the opponent's HP, and the turn is concluded.

This process repeats, until one of the players has 0 HP left.

Depending on their attribute point distribution, players will perform differently in a battle. Maxing out a certain attribute will grant more benefits for traits associated to it, but traits for other attributes will remain weak. Therefore it is up to the player to decide what kind of build they want to achieve.

Each battle requires a monetary stake from both participants. When a battle is finished, the winning player takes both stakes from the prize pool, therefore netting a profit, as well as experience points. Percentage of the total prize pool funds will be subtracted as a fee.

ROADMAP

Q3 2022

- TestNet launch DONE
- TestNet Combat training DONE
- PvP contract development DONE
- TestNet PvP DONE
- MainNet launch DONE
- PvP 2.0 In progress

Q4 2022

- PvE In progress
- PvP Leaderboard
- Alliances/Player guilds
- World boss PvE fights
- Multiverse Arena development
- Listing on all major NFT marketplaces

Q1 2023

- LegionDAO for World/Story Building
- Factions
- Legion P2E token development
- Multiverse Arena launch
- Legion P2E token launch

CONCLUSION

Chain Legion is bringing its unique GameFi vision to the BNBchain. Packed with a vibrant, expanding, engaging, story-driven universe and an exciting RPG experience.

The roadmap is rich and always expanding, our motto will always be to under-promise and over-deliver.

Our goal is to bring something new and truly unique to the BNBchain NFT space, and allow our players to directly participate in the building of the Chain Legion universe through the LegionDAO.
